UI: Quick Bar
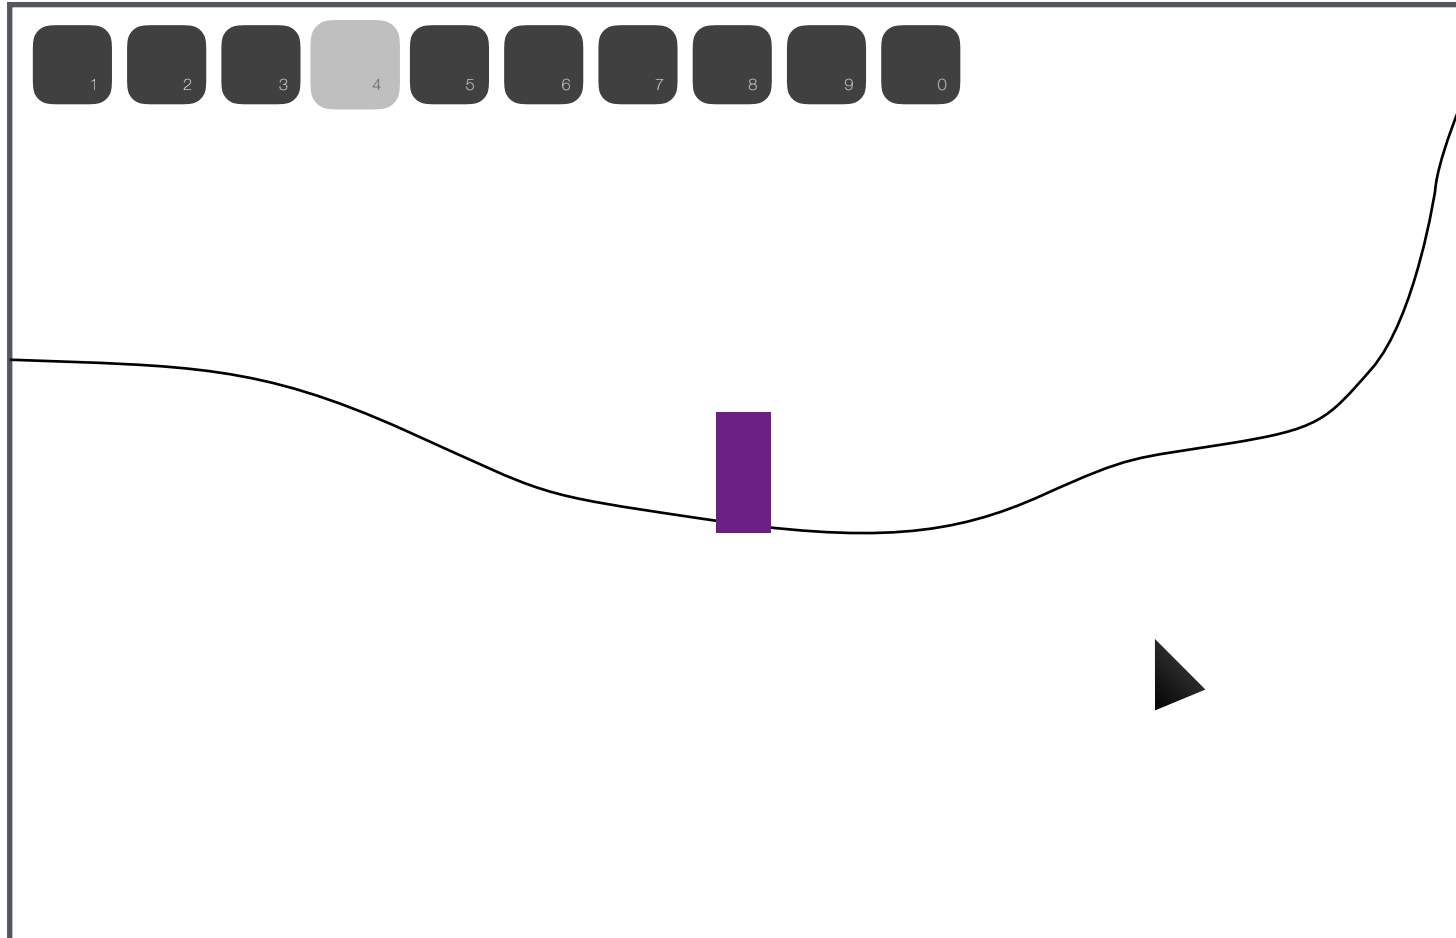

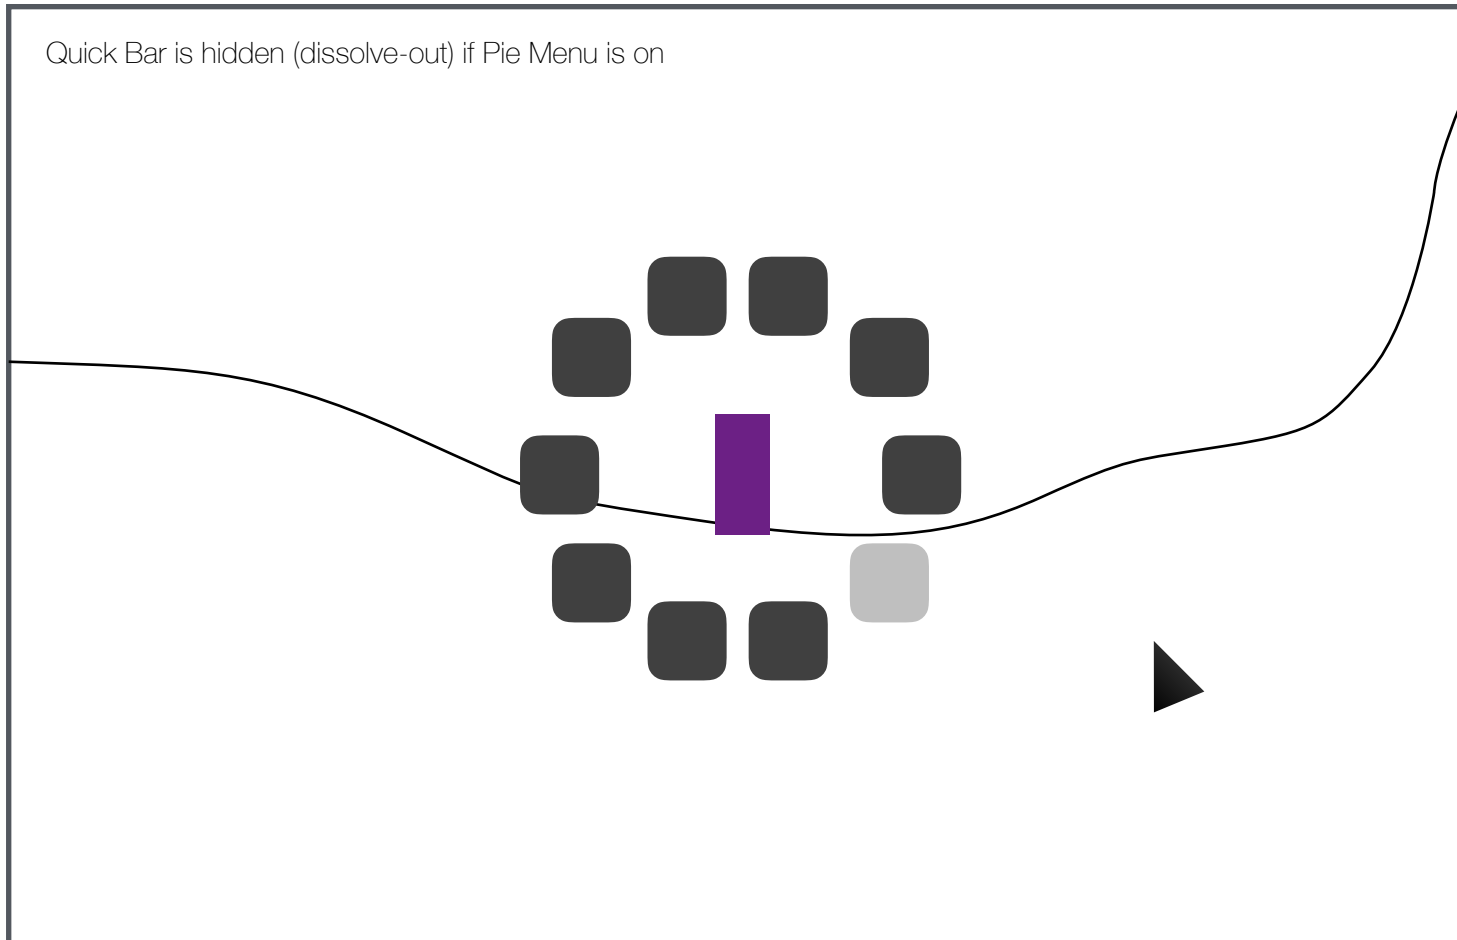

highlighted slot is ~15% larger

Can also switch item by scrolling wheel in PC, though Pie Menu can still be used on the same machine

UI: Pie Menu

Quick Bar is hidden (dissolve-out) if Pie Menu is on

Each slot is 24/32 pixels in size
(requires test to determine the right size)

Radial size is 6 times of the slot

Open: slots expand to the position, dissolve-in
Close: slots shrink to the centre, dissolve-out
(expand and shrink: whole image drawn—which represents the frame buffer—is resized, with linear filter)

Hold CapsLock to get the menu stay opened. The menu closes
when you let go of the CapsLock key

Regular decagon layout

Selection is determined by having the display divided into ten and see which triangle the cursor is on

Selected menu is highlighted

It's supposed to be a "quick selector" so we don't really need labels
